Subject: SI and H Experimentation, 2 June 1953

On Tuesday, 2 June 1953, [redacted] and the writer conducted H experimentation and research with [redacted] and [redacted] as subjects.

[redacted] opened the session by using a standard, slow induction approach and all subjects present responded exceptionally well. A simple post-H was given at this time.

A

After a short discussion, [redacted] applied the Post-H and all subjects responded at once. [redacted] then continued standard induction and standard test procedures.

Toward the conclusion of this test, all subjects were given instructions to open their eyes and were instructed to walk from the operations room into the lab where they were awakened. (Movement not yet normal.)

Thereafter, a discussion occurred in which [redacted] insisted that she was fully aware of the proceedings all the time and she had done what she had done solely to go along and could at any time have ceased is she had wished to. [redacted] then proceeded to use a fast "commanding type" technique on [redacted] and demonstrated to her and the other subjects that [redacted] had in fact actually been working in a hypnotic state and that she was rationalizing her movements upon awakening.

After some discussion, the session was concluded at approximately 9:00 PM.
